Java Examples

1. XML Signatures

Part of this software can be used to create and verify arbitrary forms of XML Signatures. The documentation available here is not very huge; my first approach is to supply usage examples which are available in the `src_samples/` directory to give interested users a first starting point to jump-start with XML Signature.

> **Note:**
> The samples divide into two groups: Samples that *create* and samples that *verify* Signatures. Eventually, you should adjust the verifying program to another filename if you get `FileNotFoundExceptions`.

2. XML Encryption

As with signatures, samples are provided to show how to encrypt and decrypt XML content. See `src_samples/org/apache/xml/security/samples/encryption`.

The samples can be compiled and run using `ant encrypt` and `ant decrypt`.
