1 Introduction

Startup is the process of getting Apache™ FOP bootstrapped and creating basic objects. Environment includes acquiring user options, instantiating any frameworks, setting up logging, etc. Control includes the basic logic for tying the various subsystems together properly.

2 Status

2.1 To Do

- avalon integration - logging, configuration, component management, caching, uri resolver
- improved interfaces
 - no threading/static problems
 - simpler to use
- better commandline handling

2.2 Work In Progress

2.3 Completed

- **better image handling** - redone so it can use a cache and synchronizes properly only on the current image while loading
